

Ronny Badilla

Platform + Governance Engineering

ronnybadilla.com/resume

- SUMMARY

I define AI governance programs and build the controls that run them, inside the teams' daily work, with the evidence an auditor asks for. My background is the platforms where governance executes: cloud, policy as code, and agents whose playbooks people approve.

- EXPERTISE

FRAMEWORK	Scope, requirements, lifecycle gates, owners, evidence, escalation.
CONTROLS	Preventive, detective, corrective controls. Templates, per-phase checklists.
LIFECYCLE	Intake, validation, registry, deployment readiness, monitoring, retirement.
AUDIT	Model documentation, AI inventory, approvals, evidence per version.
SUPERVISION	Compliance monitoring, gap analysis, risk ranking, remediation to closure.
AGENTS	Hallucination and bias evals, tool scoping, human oversight, traceability.
STACK	Policy as code, CI/CD gates, registry promotion rules, automated evidence.
PLATFORMS	AWS, Kubernetes and EKS, GitOps with ArgoCD and Helm, Terraform, EventBridge, OpenSearch, TypeScript, Python.

- **AI governance checklist** What to have in place before models and agents run your work.
- **paperops** Observability and budgets for every agent call in Paper.
- **ai-gateways-benchmark** AI gateway latency, phase by phase.

SynerOps Founder. Agent and web technology practice

2025 • NOW

- Built an agent-assisted platform engineering method. Agents propose versioned playbooks, people approve, approved guidance runs in delivery and operations.

TransUnion Governance Engineer. Project-based

2023 • 2026

- Defined the AI governance framework end to end. Scope, requirements, and a gate at every stage from intake to retirement.
- Built its control library, templates, and per-phase checklists, with an owner and evidence for every control, embedded in the daily work of the teams that build models.
- Extended governance to generative and agentic AI, including the agent platform the program governed. Evaluations, tool and permission controls, human oversight, traceability.

Automattic, Openverse Infrastructure Engineer. Project-based, about six months

2023

- Built Openverse's AWS platform from scratch, migrated the open-source search engine to it, and introduced branch-isolated previews across code, workflows, and data.

SynerOps Founder. Cloud consulting practice

2021 • 2024

- Built an observability, DevSecOps, and compliance platform for microservice estates at two enterprises, with operational, security, and cost data in one AWS data plane.
- Routed security findings through EventBridge and Step Functions into automated triage, evidence collection, ServiceNow tickets, and voice escalation on a timed playbook.
- Built a governance-as-code platform on Cloud Custodian. Serverless policy checks and remediation under FedRAMP-related requirements, customer isolation for SOC 2 and GDPR.

SoftwareONE AWS consulting practice

2018 • 2020

- Helped establish the AWS consulting practice, built a governance and cost-control solution on Cost and Usage Reports, and led due diligence for two acquisitions.

DNAMIC, Arena Edge Product team lead

2015 • 2017

- Led a dedicated product team for a video and learning platform on AWS.
